

What if your words could change a world?

Yume 夢 · a Japanese-learning game built on a live video model

*Speak Japanese.
Watch meaning become visible.*

Textbooks ask you to recognise. Yume asks you to express —
then shows you what your words did.

Live world powered by
Visko Orbis

Say it, and the world answers.

One turn: an objective, your Japanese, and a change in the running video.

PARK · LEVEL: SENTENCE

Tell the world there is a cat in the park.

こうえんにねこがいます。

There is a cat in the park.

Meaning understood → Orbis steers

Screen recording goes here — one correct turn, one wrong answer, one recovery.

- 1

It narrates to you first

The world describes itself in Japanese, aloud, pitched at your level.
- 2

Every word is tappable

Hover for reading and meaning. Double-click to keep it.
- 3

You answer, it moves

Understood meaning steers the live scene. Wrong meaning changes nothing.
- 4

Saved words come back

Spaced repetition — 1, 2, 4, 8, 16 days.
- ひとこと single word

フレーズ phrase

ぶん sentence

びょうしゃ description

The world does not wait for you.

It keeps moving on its own — the one thing a pre-rendered clip can never do.

Every 22 seconds the scene changes by itself.

- **Ambient drift**

Light shifts, petals lift, the cat wanders off.

- ! **Then it asks something of you**

“The lantern is drifting toward the pond — call out to it.” Say nothing and the story carries on without you.

You are not the only thing happening. That is what makes real time load-bearing here rather than decorative.

And someone is walking with you.

Hina — fast inference is her brain, Fish Audio is her voice, and she moves the world herself.

*Talk to her. She answers
— and the scene follows.*

YOU

ねこが かわいいですね

HINA

うん、すごくかわいいね！

“Yeah, it’s really cute!”

→ the cat trots over and settles beside you

Bilingual, so a beginner is never stranded. Speak English and she answers warmly, then hands back the Japanese you were reaching for.

Language in. A live world out.

Speech becomes a control signal. Each layer has exactly one job.

**Voice**
Narration and Hina, spoken in Japanese and English.

**App**
Next.js 16, React 19, TypeScript. Saved words live in the browser.

**Artwork**
Backgrounds, icons, and these slides. Not the live-video engine.

↪ the changed world narrates itself back to you in Japanese — and the loop starts again

Don't just learn a word. Give it a world.

Speak Japanese. Watch your words become reality.

*A dream you shape,
one sentence at a time.*

WORKING TODAY

Live steering · 5 worlds

4 levels · spoken narration

Hina · spaced repetition

NEXT TO PROVE

Interrupting her mid-sentence

Silence she fills herself

Testing with real learners
